# POWER BI BUILD GUIDE

## Executive Reporting Redesign

Kensington — The Range Group

*Step-by-Step Implementation Guide Mapped to Job Description*

---

Prepared by Sunday Dada | March 2026

# OVERVIEW

This guide provides step-by-step instructions to build the executive reporting solution described in the Kensington BI Developer job description. It maps directly to the five deliverables outlined in the JD, organized into four implementation phases. Each phase includes the exact datasets to use, DAX formulas to write, and design decisions to make.

## The Four Phases (Mapped to JD Deliverables)

| # | JD Deliverable | Primary Dataset(s) | Key Output |
|---|---|---|---|
| 1 | Enhancing & consolidating semantic models | All Fact + Dim tables, KPI_Definitions | Star schema data model |
| 2 | Implementing dynamic forecasting + Integrating financial assumptions | Forecast_Targets, Financial_Assumptions, Dim_Date | Forecast vs Actual DAX measures |
| 3 | Redesigning the front-end executive experience | All tables + DAX measures | Executive dashboard pages |
| 4 | Delivering a streamlined Power BI App | Completed .pbix file | Published Power BI App |

## Complete Dataset Inventory

| Dataset | Rows | Type | Source File |
|---|---|---|---|
| Fact_Bookings | 4,625 | Fact Table | Fact_Bookings.csv |
| Fact_Operating_Expenses | 1,008 | Fact Table | Fact_Operating_Expenses.csv |
| Fact_Forecast_Targets | 72 | Fact Table | Fact_Forecast_Targets.csv |
| Financial_Assumptions | 72 | Excel Input (Finance) | Financial_Assumptions.csv |
| Dim_Date | 1,096 | Dimension Table | Dim_Date.csv |
| Dim_Brand | 6 | Dimension Table | In Excel workbook |
| Dim_Region | 6 | Dimension Table | In Excel workbook |
| Dim_Sales_Channel | 5 | Dimension Table | In Additional workbook |
| KPI_Definitions | 14 | Reference Table | KPI_Definitions.csv |

# Phase 1: Build the Consolidated Semantic Model

This is the foundation. Everything else depends on getting the data model right. The JD says the current environment has fragmented semantic models across multiple companies. Your job is to unify them into a single, optimized star schema.

## Step 1.1: Create a New Power BI Desktop File

- Open Power BI Desktop and save the file as: **Kensington_Executive_Reporting.pbix**
- Before loading any data, set the file's regional locale to English (United States) under File > Options > Regional Settings

## Step 1.2: Import the Fact Tables

Go to Home > Get Data > Text/CSV and import these three files:

1. **Fact_Bookings.csv** — 4,625 rows of booking transactions with Gross_Sales, Gross_Margin, Commission, Net_Revenue
2. **Fact_Operating_Expenses.csv** — 1,008 rows of monthly OpEx by brand and expense category
3. **Fact_Forecast_Targets.csv** — 72 rows of 2026 forecast targets with prior year comparisons

## Step 1.3: Import the Dimension Tables

Import from the Excel workbooks or CSV files:

4. **Dim_Date.csv** — 1,096 rows covering 2024–2026. This is your calendar table for all time intelligence calculations
5. **Dim_Brand** (from Kensington_Executive_Reporting_Dataset.xlsx, sheet Dim_Brand)
6. **Dim_Region** (from same workbook, sheet Dim_Region)
7. **Dim_Sales_Channel** (from Kensington_Additional_Datasets.xlsx, sheet Dim_Sales_Channel)

## Step 1.4: Import the Financial Assumptions Table

Import **Financial_Assumptions.csv**. This simulates the Excel-based input from the Finance team that the JD specifically mentions. In the real Kensington environment, this would be a SharePoint-hosted Excel file that the finance team updates monthly.

## Step 1.5: Import the KPI Definitions Table

Import **KPI_Definitions.csv**. This is your reference table for standardized KPI definitions across all brands — ensuring “Gross Margin” means the same thing for Tours, Cruise, Villas, and Jets.

## Step 1.6: Transform Data in Power Query

Open Power Query Editor (Transform Data) and apply these transformations:

**Fact_Bookings:**

- Change Booking_Date and Travel_Date columns to Date data type
- Create a calculated column: Year_Month = Date.ToText([Booking_Date], "yyyy-MM")
- Create a calculated column: Booking_Year = Date.Year([Booking_Date])
- Create a calculated column: Booking_Month = Date.Month([Booking_Date])
- Ensure all currency columns (Gross_Sales, Gross_Margin, Commission, Net_Revenue) are Decimal Number type

**Fact_Operating_Expenses:**

- Create a calculated column: Date = #date([Year], [Month], 1) — this creates the first of each month as a date key

- Ensure Amount is Decimal Number type

**Fact_Forecast_Targets:**

- Create a calculated column: Date = #date([Year], [Month], 1)
- Ensure all numeric columns are Decimal Number type

**Dim_Date:**

- Change the Date column to Date data type
- Mark this table as the Date Table: In Model view, select Dim_Date > Table Tools > Mark as Date Table > select the Date column

**Financial_Assumptions:**

- Create a calculated column: Date = #date([Year], [Month], 1)
- Ensure all percentage columns are Decimal Number type (not Percentage — store as 0.15, not 15%)

## Step 1.7: Build the Star Schema Relationships

Go to Model view and create these relationships. This is the consolidated semantic model:

**Relationships from Dim_Date:**

- Dim_Date[Date] → Fact_Bookings[Booking_Date] (1:Many, Active)
- Dim_Date[Date] → Fact_Bookings[Travel_Date] (1:Many, Inactive — use USERELATIONSHIP in DAX when you need to analyze by travel date instead of booking date)
- Dim_Date[Date] → Fact_Operating_Expenses[Date] (1:Many, Active)
- Dim_Date[Date] → Fact_Forecast_Targets[Date] (1:Many, Active)
- Dim_Date[Date] → Financial_Assumptions[Date] (1:Many, Active)

**Relationships from Dim_Brand:**

- Dim_Brand[Brand] → Fact_Bookings[Brand] (1:Many)
- Dim_Brand[Brand] → Fact_Operating_Expenses[Brand] (1:Many)
- Dim_Brand[Brand] → Fact_Forecast_Targets[Brand] (1:Many)
- Dim_Brand[Brand] → Financial_Assumptions[Brand] (1:Many)

**Relationships from Dim_Region:**

- Dim_Region[Region] → Fact_Bookings[Region] (1:Many)

**Relationships from Dim_Sales_Channel:**

- Dim_Sales_Channel[Sales_Channel] → Fact_Bookings[Sales_Channel] (1:Many)

**■ CHECKPOINT: Your model should have 9 tables in a clean star schema with Dim tables surrounding Fact tables. No table should be unrelated.**

---

## Step 1.8: Implement Row-Level Security (RLS)

Go to Modeling > Manage Roles and create these roles:

- **Brand Manager — Tours:** DAX filter on Dim_Brand: [Brand] = "Luxury Tours"
- **Brand Manager — Cruise:** DAX filter on Dim_Brand: [Brand] = "Premium Cruise"
- **Brand Manager — Villas:** DAX filter on Dim_Brand: [Brand] = "Private Villas"
- **Brand Manager — Jets:** DAX filter on Dim_Brand: [Brand] = "Private Jets"
- **Brand Manager — Air:** DAX filter on Dim_Brand: [Brand] = "Commercial Air"
- **Brand Manager — Corporate:** DAX filter on Dim_Brand: [Brand] = "Corporate Travel"
- **Executive (All Brands):** No filter — sees everything

This demonstrates the drill-down by company capability the JD requires. Each brand manager only sees their brand; executives see the full portfolio.

## Phase 2: Build DAX Measures for Forecasting and Financial Integration

This phase is the technical core of the role. You’ll create all the DAX measures that power the executive dashboard — from basic KPIs to time intelligence, forecasting, and profit calculations incorporating operating expenses.

### Step 2.1: Create a Measures Table

In Model view, create a dedicated Measures table (Enter Data > name it "_Measures" with one blank column). This keeps all DAX measures organized in one place. Delete the default column after creating your first measure.

### Step 2.2: Core KPI Measures

Create these base measures in the _Measures table:

```
Gross Sales = SUM(Fact_Bookings[Gross_Sales])
Gross Margin = SUM(Fact_Bookings[Gross_Margin])
Gross Margin % = DIVIDE([Gross Margin], [Gross Sales], 0)
Total Commission = SUM(Fact_Bookings[Commission])
Commission % = DIVIDE([Total Commission], [Gross Sales], 0)
Net Revenue = SUM(Fact_Bookings[Net_Revenue])
Booking Count = COUNTROWS(Fact_Bookings)
Avg Booking Value = DIVIDE([Gross Sales], [Booking Count], 0)
Cancellation Rate = DIVIDE(CALCULATE(COUNTROWS(Fact_Bookings), Fact_Bookings[Status] =
"Cancelled"), COUNTROWS(Fact_Bookings), 0)
```

### Step 2.3: Operating Expense and Profit Measures

**This is the key gap Kensington currently has.** The JD says they lack “profit visibility incorporating operating expense assumptions.” These measures solve that:

```
Total OpEx = SUM(Fact_Operating_Expenses[Amount])
Operating Profit = [Net Revenue] - [Total OpEx]
Operating Margin % = DIVIDE([Operating Profit], [Gross Sales], 0)
```

OpEx breakdown measures (for drill-down by expense category):

```
Staff Cost = CALCULATE([Total OpEx], Fact_Operating_Expenses[Expense_Category] = "Staff &
Salaries")
Marketing Cost = CALCULATE([Total OpEx], Fact_Operating_Expenses[Expense_Category] = "Marketing &
Advertising")
Technology Cost = CALCULATE([Total OpEx], Fact_Operating_Expenses[Expense_Category] = "Technology
& Platform")
```

### Step 2.4: Time Intelligence Measures

These enable period-over-period comparisons — the “forward-looking” capability the JD demands:

```
Gross Sales PY = CALCULATE([Gross Sales], SAMEPERIODLASTYEAR(Dim_Date[Date]))
YoY Growth % = DIVIDE([Gross Sales] - [Gross Sales PY], [Gross Sales PY], 0)
Gross Sales MTD = TOTALMTD([Gross Sales], Dim_Date[Date])
Gross Sales YTD = TOTALYTD([Gross Sales], Dim_Date[Date])
Gross Sales QTD = TOTALQTD([Gross Sales], Dim_Date[Date])
Gross Margin PY = CALCULATE([Gross Margin], SAMEPERIODLASTYEAR(Dim_Date[Date]))
Gross Margin YoY % = DIVIDE([Gross Margin] - [Gross Margin PY], [Gross Margin PY], 0)
Operating Profit PY = CALCULATE([Operating Profit], SAMEPERIODLASTYEAR(Dim_Date[Date]))
Operating Profit YoY % = DIVIDE([Operating Profit] - [Operating Profit PY], [Operating Profit PY],
0)
```

## Step 2.5: Dynamic Forecasting Measures

**These connect the Forecast_Targets and Financial_Assumptions tables to actuals.** This is the dynamic forecasting logic the JD explicitly calls for:

```
Forecast Gross Sales = SUM(Fact_Forecast_Targets[Forecast_Gross_Sales])
Forecast Gross Margin = SUM(Fact_Forecast_Targets[Forecast_Gross_Margin])
Forecast Bookings = SUM(Fact_Forecast_Targets[Forecast_Bookings])
Forecast Variance $ = [Gross Sales] - [Forecast Gross Sales]
Forecast Variance % = DIVIDE([Forecast Variance $], [Forecast Gross Sales], 0)
```

Month-End Forecast (blended actual + projected):

```
Month End Forecast =
  VAR CurrentDay = DAY(TODAY())
  VAR DaysInMonth = DAY(EOMONTH(TODAY(), 0))
  VAR ActualToDate = [Gross Sales MTD]
  VAR DailyRunRate = DIVIDE(ActualToDate, CurrentDay, 0)
  VAR ProjectedTotal = DailyRunRate * DaysInMonth
  RETURN ProjectedTotal
```

**Important note:** This measure uses TODAY() which is dynamic. Since the demo dataset only contains 2024–2025 data, this measure will return blank when tested against historical months. For the demo, create an alternative version that uses a fixed reference date:

```
Month End Forecast Demo =
  VAR ReferenceDate = DATE(2025, 6, 15) -- Simulates mid-June 2025
  VAR CurrentDay = DAY(ReferenceDate)
  VAR DaysInMonth = DAY(EOMONTH(ReferenceDate, 0))
  VAR ActualToDate = CALCULATE([Gross Sales], Dim_Date[Date] <= ReferenceDate, Dim_Date[Year] =
2025, Dim_Date[Month_Number] = 6)
  VAR DailyRunRate = DIVIDE(ActualToDate, CurrentDay, 0)
  VAR ProjectedTotal = DailyRunRate * DaysInMonth
  RETURN ProjectedTotal
```

In a live environment, switch back to the TODAY() version. Show both during the interview to demonstrate you understand the difference between demo and production.

## Step 2.6: Financial Assumption Integration Measures

These pull directly from the Excel-based Financial_Assumptions table — **exactly what the JD means by "integrating financial assumptions" and "integrating Excel-based inputs into BI models":**

```
Target Margin % = AVERAGE(Financial_Assumptions[Gross_Margin_Target_Pct])
Target Revenue Growth % = AVERAGE(Financial_Assumptions[Revenue_Growth_Target_Pct])
Budget Marketing = SUM(Financial_Assumptions[Marketing_Budget])
Assumed Cancellation Rate = AVERAGE(Financial_Assumptions[Cancellation_Rate_Assumption])
Margin vs Target = [Gross Margin %] - [Target Margin %]
Revenue vs Growth Target = [YoY Growth %] - [Target Revenue Growth %]
```

**■ CHECKPOINT: You should now have 35+ DAX measures covering KPIs, profitability, time intelligence, forecasting, financial assumptions, and scenario analysis. Test each measure by placing it in a table visual with Brand as rows.**

## Phase 3: Design the Executive Dashboard Pages

This is where the executive-level synthesis happens. The JD says the current dashboard shows top-line numbers but lacks synthesis, drill-down, and profit visibility. Your dashboard fixes all three.

### Page 1: Executive Summary (Landing Page)

**Purpose:** Portfolio-level view across all brands. This is the page the CEO opens first.

**Top Section — KPI Cards (single row):**

- Card 1: Total Gross Sales (with YoY % change as subtitle)
- Card 2: Gross Margin % (with conditional formatting: green if above target, red if below)
- Card 3: Operating Profit (with YoY % change)
- Card 4: Operating Margin %
- Card 5: Booking Count (with YoY % change)
- Card 6: Forecast Variance % (green if positive, red if negative)

**Middle Section — Two Charts Side by Side:**

- **Left:** Clustered Column Chart — Gross Sales by Brand. Each bar represents one brand (6 bars). Add a line overlay for Operating Profit by Brand. This immediately shows which brands generate revenue vs. which are actually profitable.
- **Right:** Line Chart — Monthly trend showing Gross Sales (line 1), Gross Margin (line 2), and Operating Profit (line 3) over time. Add a dashed forecast line for 2026 targets using the Forecast Gross Sales measure.

**Bottom Section — Summary Table:**

- Matrix visual with Brand as rows
- Columns: Gross Sales, Gross Margin %, Commission %, OpEx, Operating Profit, Operating Margin %, YoY Growth %, Forecast Variance %
- Add conditional formatting (data bars for Gross Sales, background color for Operating Margin %)
- Add sparklines for monthly Gross Sales trend per brand

**Slicer Bar (top of page):**

- Year slicer (horizontal buttons: 2024, 2025)
- Quarter slicer (horizontal buttons: Q1, Q2, Q3, Q4)
- Status slicer (Confirmed, Completed, Cancelled, Pending)

### Page 2: Brand Deep Dive (Drill-Through Page)

**Purpose:** Click on any brand from Page 1 to drill through to its full P&L. This is the “structured drill-down by company and line of business” the JD requires.

**Setup:**

- Enable drill-through: Add Brand to the drill-through filter on this page
- When users right-click a brand on Page 1, they’ll arrive here with that brand pre-filtered

**Layout:**

- **Header:** Dynamic title showing the selected brand name (use a DAX measure: Brand Title = "Brand Deep Dive: " & SELECTEDVALUE(Dim_Brand[Brand], "All Brands"))
- **Top Row — KPI Cards:** Same 6 KPIs as Page 1 but filtered to this brand
- **Waterfall Chart:** Gross Sales → minus COGS (calculated as Gross Sales minus Gross Margin) → Gross Margin → minus Commission → Net Revenue → minus OpEx → Operating Profit. Create a supporting measure: COGS = [Gross Sales] - [Gross Margin]. This waterfall tells the complete profit story for the brand.
- **OpEx Breakdown:** Stacked bar chart or treemap showing Expense_Category breakdown (Staff, Marketing, Technology, etc.) for this brand

- **Trend Chart:** Monthly Gross Sales vs. Forecast line for this brand, with prior year as a faded comparison line
- **Region Performance:** Table or map showing this brand's performance by Region and top Destinations
- **Back button:** Add a "Back to Executive Summary" button for navigation

### Page 3: Forecast & Financial Assumptions

**Purpose:** Forward-looking month-end forecasting with integrated financial assumptions. This is the page that turns reactive reporting into predictive reporting.

**Layout:**

- **Forecast vs. Actual Table:** Matrix with Month as rows, Brand as columns. Values: Actual Gross Sales, Forecast Gross Sales, Variance $, Variance %. Use conditional formatting (green/red) on variance.
- **Month-End Projection:** Card showing the Month End Forecast measure with a gauge visual comparing it to the target
- **Assumptions Panel:** Table showing the Financial_Assumptions data — Revenue Growth Target, Margin Target, OpEx Growth, Marketing Budget by brand. This shows leadership exactly what assumptions drive the forecast.
- **Scenario Comparison:** Use a What-If parameter (Modeling > New Parameter) to let users adjust the growth rate assumption (e.g., slider from 5% to 25%) and see how it affects projected revenue and profit. Name it "Growth Rate Adjustment." Create the parameter, then create these DAX measures that use it:

```
Adjusted Forecast Sales = [Forecast Gross Sales] * (1 + 'Growth Rate Adjustment'[Growth Rate Adjustment Value])
Adjusted Forecast Profit = [Adjusted Forecast Sales] * [Target Margin %] - [Total OpEx]
Adjusted vs Base Forecast = [Adjusted Forecast Sales] - [Forecast Gross Sales]
```

- **YoY Comparison Chart:** Grouped bar chart: 2024 vs 2025 vs 2026 Forecast by brand

### Page 4: Sales Channel & Operational Detail

**Purpose:** Operational drill-down for mid-level managers who need granular data.

**Layout:**

- **Channel Mix:** Donut chart showing Gross Sales by Sales_Channel (Direct Online, Travel Advisor, Phone, Corporate, Referral)
- **Commission Analysis:** Bar chart comparing Commission % by Sales Channel and by Brand
- **Booking Status:** Funnel visual: Pending → Confirmed → Completed → Cancelled
- **Destination Heatmap:** Table or map showing bookings and revenue by Destination, with filters for Brand and Region
- **Booking Trend:** Line chart showing daily/weekly booking volume to spot trends and seasonality

### Step 3.5: Apply Consistent Formatting

Apply these design standards across all pages:

- Color theme: Use Kensington's brand colors (dark navy, gold/amber accents) or a professional corporate palette
- Font: Segoe UI or DIN for a clean, modern look
- Background: Light gray (#F5F5F5) or white for pages
- Card style: White cards with subtle shadows on gray background
- All currency values formatted as $#,##0 (no decimals for large numbers)
- All percentages formatted as 0.0%
- Consistent title placement: top-left of each page with the page name
- Navigation buttons on every page: Home, Brand Dive, Forecast, Operations

### Step 3.6: Sync Slicers Across Pages

Go to View > Sync Slicers and configure:

- Year slicer: sync across all 4 pages so the user's year selection persists when navigating

- Quarter slicer: sync across Pages 1, 3, and 4 (Page 2 is drill-through filtered, so quarter context comes from the source page)
- Status slicer: sync across Pages 1 and 4 only (Forecast page and Brand Dive should show all statuses by default)

This prevents users from having to re-select filters on every page — critical for executive usability.

### Step 3.7: Create Bookmarks for Toggle Views

Create bookmarks (View > Bookmarks) for toggle functionality on Page 1:

- **Bookmark 1: "Revenue View"** — shows Gross Sales and Gross Margin in the column chart
- **Bookmark 2: "Profit View"** — shows Operating Profit and Operating Margin % in the column chart
- Add toggle buttons on Page 1 that switch between these bookmarks. Use Insert > Buttons > Blank button, assign the bookmark action, and label them "Revenue" and "Profit."

This lets the CEO toggle between a revenue-focused and profit-focused view without cluttering the page with too many visuals.

### Step 3.8: Build Custom Tooltip Pages

Create two hidden tooltip pages for rich hover experiences:

- **Tooltip: Brand Summary —** Page size: Tooltip (320x240). Add: Brand name, Gross Sales, Operating Profit, Margin %, sparkline of monthly trend. Assign to the bar chart on Page 1 so hovering over a brand bar shows its mini P&L.
- **Tooltip: Destination Detail —** Page size: Tooltip. Add: Destination name, Booking Count, Avg Booking Value, Top Sales Channel. Assign to the destination visuals on Page 4.

Set each page's Page Information > Allow use as tooltip = On, and set page size to Tooltip under Format > Canvas Settings.

### Step 3.9: Add Travel Date Analysis Measure

The data model has an inactive relationship from Dim_Date to Fact_Bookings[Travel_Date]. Create this measure to enable analysis by when customers actually travel (not when they book):

```
Gross Sales by Travel Date = CALCULATE([Gross Sales], USERELATIONSHIP(Dim_Date[Date],
Fact_Bookings[Travel_Date]))
```

Add this as an optional toggle on the trend chart (Page 1 or Page 4) so leadership can switch between booking-date and travel-date views. This is especially valuable for understanding seasonality of actual travel vs. booking patterns.

**■ CHECKPOINT: You should now have 4 dashboard pages with consistent formatting, drill-through enabled, synced slicers, bookmark toggles, custom tooltips, and all 35+ measures visualized.**

# Phase 4: Package and Deliver as a Power BI App

This final phase packages everything into a clean, distributable Power BI App that leadership accesses through a single entry point.

## Step 4.1: Optimize Performance Before Publishing

- Run Performance Analyzer (View > Performance Analyzer) on each page. Identify any visual taking >2 seconds and optimize
- Remove any unused columns from the data model (right-click column > Hide or delete in Power Query)
- Ensure all relationships use single-direction cross-filtering unless bidirectional is explicitly needed
- Check file size: target under 100MB. If larger, consider aggregations or reducing date granularity
- Use variables (VAR) in complex DAX to avoid repeated calculations

## Step 4.2: Configure the Workspace

- Create a dedicated workspace in Power BI Service named: "Kensington Executive Reporting"
- Set workspace access: Admin for yourself, Viewer for leadership
- Publish the .pbix file to this workspace

## Step 4.3: Set Up Scheduled Refresh

- In Power BI Service, go to the dataset settings
- Configure a Gateway connection if data sources are on-premises
- Set scheduled refresh: twice daily (6 AM and 12 PM) or as required
- Enable email notifications for refresh failures

## Step 4.4: Create the Power BI App

- In the workspace, click "Create App"
- Set the App name: "Kensington Executive Reporting"
- Add a description: "Portfolio-level performance, profitability, and forecasting across all Kensington brands"

**Configure the App navigation:**

1. **Executive Summary** (landing page — set as default)
2. **Brand Deep Dive** (drill-through page)
3. **Forecast & Assumptions** (forward-looking page)
4. **Sales & Operations** (detail page)

- Set audience: Publish to the leadership group or specific users
- Enable "Allow users to make a copy of the reports" for power users who want to explore further
- Publish the App

## Step 4.5: Configure Row-Level Security in Service

- In Power BI Service, go to the dataset > Security
- Assign users to the RLS roles you created in Phase 1
- Test by selecting "Test as role" for each brand manager role

## Step 4.6: Create a Deployment Checklist

| # | Checklist Item | Status |
|---|---|---|
| 1 | Star schema data model with all 9 tables connected | ☐ |

| | | |
|---|---|---|
| 2 | 35+ DAX measures (KPIs, time intelligence, forecasting, profitability, scenario analysis) | ☐ |
| 3 | Row-Level Security configured and tested for all 6 brand roles + Executive | ☐ |
| 4 | 4 dashboard pages with consistent formatting | ☐ |
| 5 | Drill-through from Executive Summary to Brand Deep Dive working | ☐ |
| 6 | Financial Assumptions integrated and visible in Forecast page | ☐ |
| 7 | What-If parameter for scenario analysis with DAX measures working | ☐ |
| 8 | Slicers synced across all pages (Year, Quarter, Status) | ☐ |
| 9 | Bookmarks for Revenue/Profit toggle on Executive Summary | ☐ |
| 10 | Custom tooltip pages (Brand Summary, Destination Detail) | ☐ |
| 11 | Performance Analyzer: all visuals under 2 seconds | ☐ |
| 12 | Published to Power BI Service workspace | ☐ |
| 13 | Power BI App created with clean navigation and correct audience | ☐ |
| 14 | Scheduled refresh configured | ☐ |

## How This Maps to the Interview

When presenting this project in the next interview round, frame it using the JD's own language:

- ***"Redesigning the front-end executive experience"*** → Pages 1 and 2 (Executive Summary + Brand Deep Dive)
- ***"Enhancing and consolidating underlying semantic models"*** → Star schema with 9 tables, standardized KPI definitions, RLS
- ***"Implementing dynamic forecasting logic"*** → Time intelligence measures, Forecast vs. Actual, Month-End Projection, What-If parameter
- ***"Integrating financial assumptions"*** → Financial_Assumptions table from Excel, margin targets, growth assumptions visible in dashboard
- ***"Delivering a streamlined Power BI App for leadership"*** → Published App with 4-page navigation, RLS, scheduled refresh

**When they ask "why did you build this?" your answer is:** "I read the job description, identified the exact gaps — no profit visibility, no forecasting, no drill-down by company — and built the solution. This is what I'll deliver for Kensington."

---

*End of Guide*
